

Primary outcome — major hemorrhage event (composite): a hemorrhage-control procedure (surgical or angiographic), hemorrhagic death (in-hospital death with head AIS < 4, within 48 h of arrival), or substantial transfusion (≥ 1000 mL or ≥ 4 units of packed red cells within 4 h). Any one component is sufficient.

Hemorrhage control is a component of the outcome, not an eligibility criterion: the cascade above is the pre-decision cohort, so no patient is excluded for failing to receive an intervention.
